

## Decentralization as Texture

Implicit in the current campaign to “decentralize” the web is a desire to remodel the medium of exchange into a more equitable form. The internet began with this same architectural premise, yet its cumulative structure has since proven inadequate.

If we are to work toward decentralization as a collective ideal, we must reevaluate what it means for a network to have such a property, and how to realize those ends.

The talks in this program aim to decompose the term along multiple dimensions, so as to encourage the conversation surrounding decentralized technology to unfold with greater specificity.
